Questions and Answers:

Question 1 asks to describe strategies on implementing 'integration' but I'd like to clarify if that means local integration of IAQ to the broader BAS network OR the integration of the different systems onto a single unified platform? Or would require info on both?

As stated in the Scope Statement, we're looking to integrate several base building systems, BAS included, onto a unified platform.

Question 4 mentions 'post-implementation support' and I'd like to confirm if warranty, maintenance and SLA's are considered various methods of achieving this or if you're looking for specific on-site training strategies?

We would consider warranties, post installation maintenance, training, SLA's, as well as 24/7 technical support (for a defined period).

Question 5 mentions 'end of life assets' – can I assume it is strictly referencing BAS related assets or does this include mechanical/ electrical/ sprinkler equipment as well?

This in reference to potential system integration and any required hardware, appliances, software, applications, platforms, etc.
